## ICMarkets WEB API .NET Developer Project

Greetings from ICMarkets team.

The purpose of this project is to validate the candidate's approach of designing a Web API. The app stores all data into the database from ETH, Dash, BTC, LTC API(s). Source *Blockcypher*:

- 1. <a href="https://api.blockcypher.com/v1/eth/main">https://api.blockcypher.com/v1/eth/main</a>
- 2. <a href="https://api.blockcypher.com/v1/dash/main">https://api.blockcypher.com/v1/dash/main</a>
- 3. <a href="https://api.blockcypher.com/v1/btc/main">https://api.blockcypher.com/v1/btc/main</a>

**Documentation:** <u>Blockchain API – Blockchain Developer API for Bitcoin, Ethereum, Testnet, Litecoin and More | BlockCypher</u>

## Minimum Functionality needed:

- 1. .NET Core Application based on clean or vertical architecture with SOLID.
- 2. API endpoints that show all https requests into Swagger endpoints. The API endpoints must show the history of each blockchain's data stored in the database.
- 3. Storing blockchain's data into the database with additional timestamp <u>CreatedAt</u>. A new column adding the time requested from the API endpoint. The history of data should be shown with the <u>CreatedAt</u> in descending order.
- 4. HealthChecks route and basic CORS policy.
- 5. Dependency injection, logging, model mapping, API serialization, automatic behavior validation.
- 6. Integration, Functional and Unit Test projects.
- 7. Runtime profiles on .NET, Docker (Linux) (..)

## Frameworks Requirements:

- 1. Implementation with .NET Core preferrable >= .NET 6
- 2. Database options of your choice: SQLite (EF) or Database in Docker, or NoSQL.
- 3. Main data should be stored as provided in theAPI's JSON responses.
- 4. The app must illustrate best practices based on performance, inheritance and scalability.
- 5. Asynchronous or parallel event patterns.e.g Tasks, PLinq (..)
- 6. Provide at least two design patterns: UOW, Repository, CQRS, Event Sourcing,
- 7. Optional: API Gateway

Please, the solution should be submitted back to the email by providing a public github URL, a ReadMe.md file with instructions. The repository should have <u>main</u> and <u>development</u> branches.

## **Best of Luck!**
